

Appendix H

SPECIFYING USER EXITS

In a program it is possible to specify your own user exit routine. The run-time element ZYQUSERX is defined for this purpose.

The routine is called after sysin and sysout have been opened, but before the first i/o has been performed.

The DCB addresses of sysin and sysout are passed as parameters in the standard OS manner.

In the default case, the routine is only a dummy routine.
